

Wave Petunia Trials

As reported by
Scott Carver, Spokane Valley High School

- *Planted Petunias in 12" hanging baskets on February 17 and 21, 2005*
- *Maintained greenhouse temperatures of 68° daytime and 48° night until the plant sale during the first week of May*
- *Fertilized daily with continuous feeding of 150 ppm Nitrogen of Peter's Professional 21-5-20 soluble fertilizer.*
- *Trimmed petunias back to the rim of the baskets on March 31, then let them grow until the sale in May.*
- *Next year, I'm switching to a 20-20-20 fertilizer and increasing night temperatures to 52° in hopes of obtaining fuller baskets.*
